

Repo Architecture

Generated: 2026-05-01 13:55:07 PDT

Overview

This repository is a small static GitHub Pages portfolio site served from docs/.

It has no build step, backend service, database, or framework dependency.

The homepage is a static shell that fetches JSON content and renders sections in the browser.

Key Files

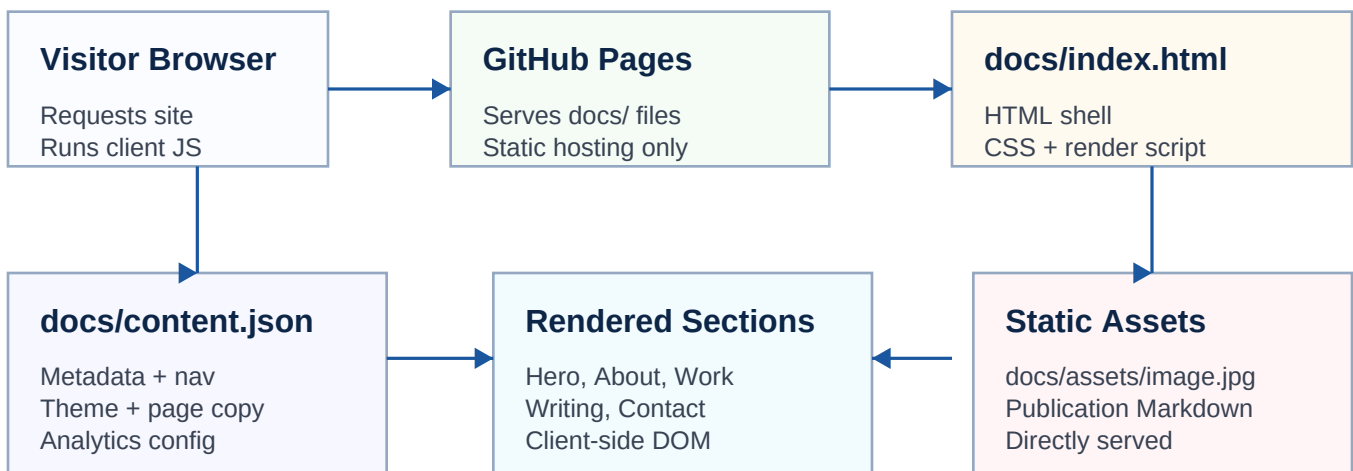

docs/index.html - page shell, CSS, render functions, content fetcher, analytics hook

docs/content.json - navigation, theme, copy, work sections, writing links, contact data

docs/assets/image.jpg - profile image used by the hero section

docs/publications/index.md - publications landing page linked from the main nav

Architecture Diagram

Runtime Flow

1. Browser loads docs/index.html from GitHub Pages.
2. The script fetches ./content.json with cache disabled.
3. JSON data is escaped and injected into predefined section roots.
4. Image assets and Markdown publication pages are served as static files.

Deployment Model

Publish the docs/ folder with GitHub Pages. Content updates usually happen in docs/content.json. Longer articles can live as Markdown pages under docs/publications/.
